Barabasi book on network science

How to describe importance of nodes?

Network measures: How to describe a network?

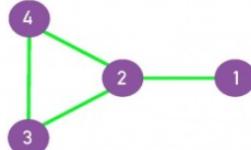

How to describe a network?

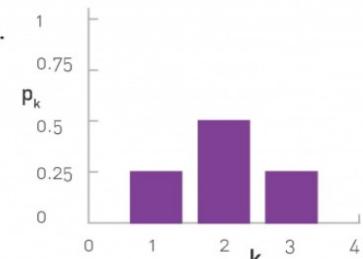

Degree of node A is the number of nodes adjacent with the node A.

Plotting degree distribution for a network can give important insight on its properties.

Network Data Statistics	
Nodes	34
Edges	78
Density	0.139037
Maximum degree	17
Minimum degree	1
Average degree	4
Assortativity	-0.475613
Number of triangles	135
Average number of triangles	3
Maximum number of triangles	18
Average clustering coefficient	0.570638
Fraction of closed triangles	0.255682
Maximum k-core	5
Lower bound of Maximum Clique	5

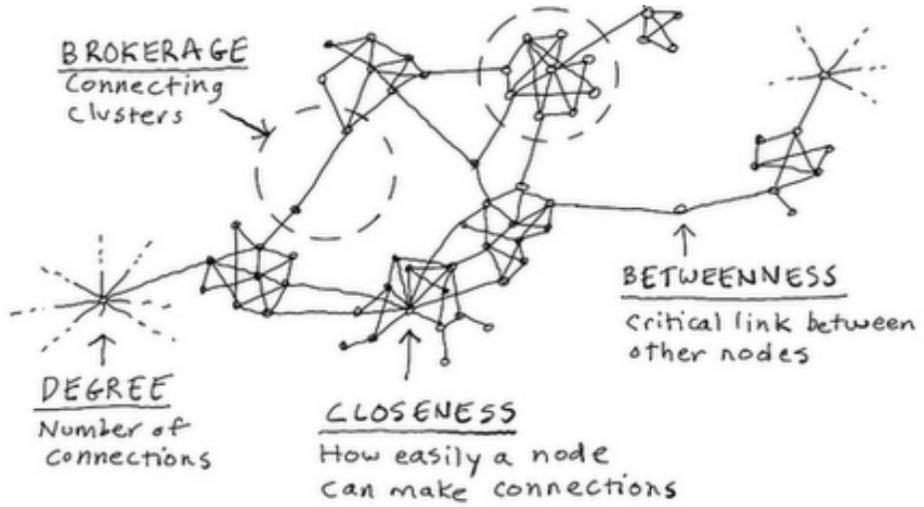

Scale-free networks (lecture 1)

"Scale free networks can be found in many places" ... at the same time
"Be careful with power-laws"

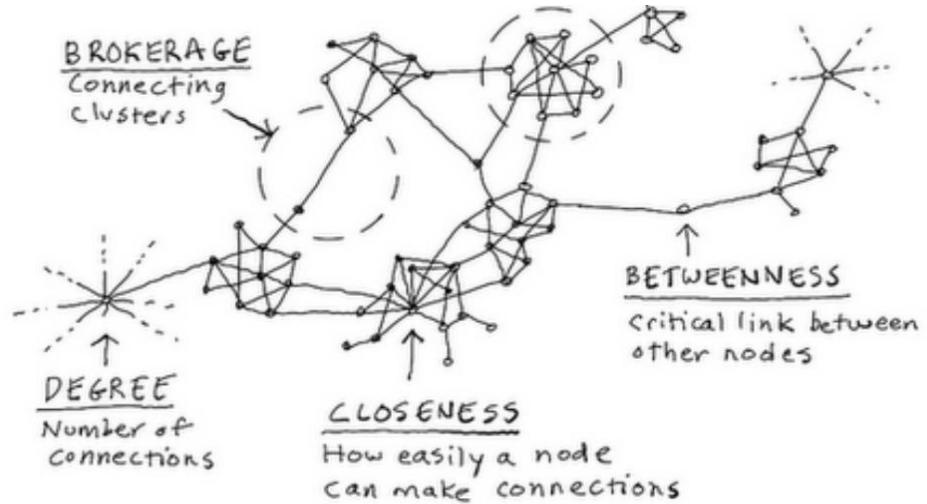

Cytoscape software alternative to Gephi for biological networks
Barabasi book

Network measures: clustering

$$C_i = \frac{|\{e_{jk} : v_j, v_k \in N_i, e_{jk}|}{k_i(k_i - 1)}$$

Network measures: betweenness centrality

$$g(v) = \sum_{s \neq v \neq t} \frac{\sigma_{st}(v)}{\sigma_{st}}$$

Additional notions:

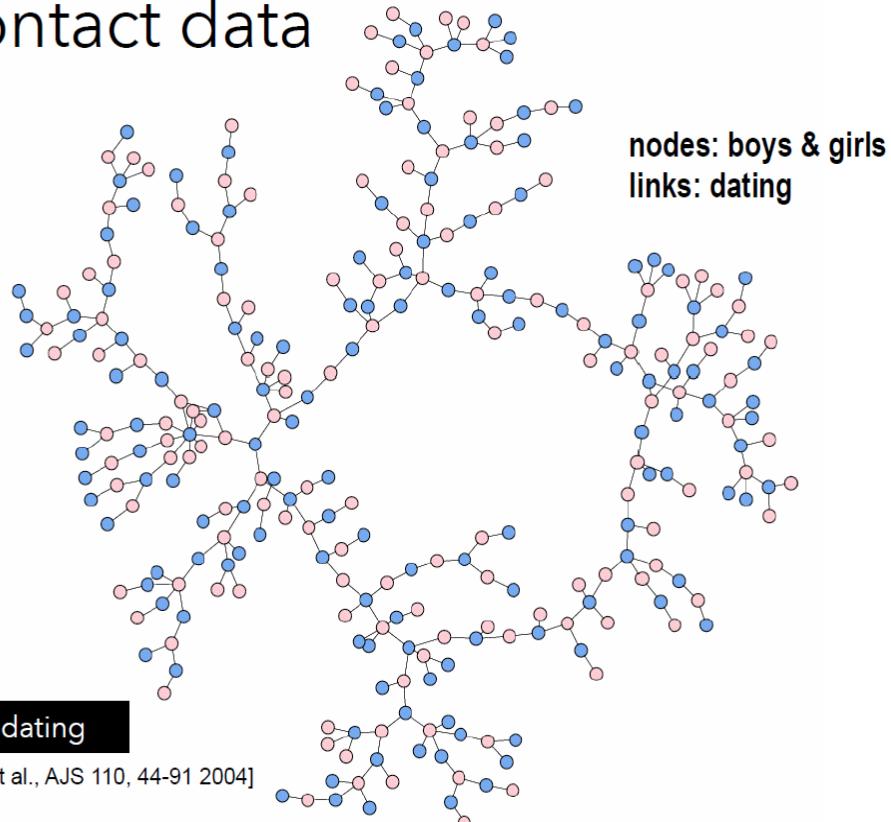

Paths in a network

Shortest paths

Random walks on a network

For your projects: How to analyze networks with network measures?

many metrics...

TABLE 2: Definitions of network science terms and variables.

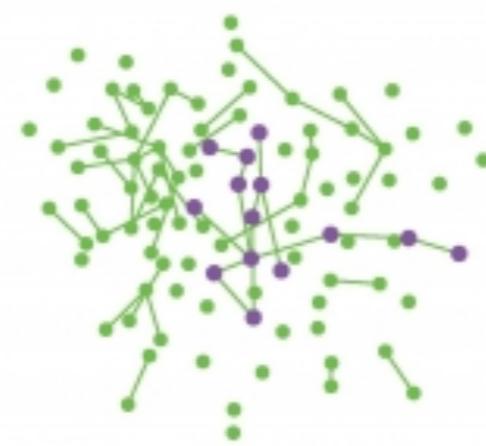

Term/variable	Definition
N	number of nodes, N , in graph
E	number of edges, E , in graph
network density	ratio of the number of edges to the maximum number of possible edges $\frac{2E}{N(N - 1)}$
distance, $d(n_i, n_j)$	shortest path between node i and node j $d(n_i, n_j)$ where $n_i, n_j \in N$
average shortest path length, L	average length of shortest path between pairs of nodes $L = \frac{1}{N(N - 1)} \cdot \sum_{i \neq j} d(n_i, n_j)$
diameter, D	largest shortest path between nodes $D = \max_{n_i \in N, n_j \in N} d(n_i, n_j)$
closeness centrality	inverse of the sum of the length of the shortest paths between node i and all other nodes in the graph $C_i = \frac{1}{\sum_j d(n_i, n_j)}$
degree, k_i	number of edges attached to node i
average degree, $\langle k \rangle$	average number of edges per node in network $\langle k \rangle = \frac{1}{N} \sum_{n=1}^N k_i$
local clustering coefficient, c_i	number of edges between the neighbors of node i divided by the maximum number of edges between those neighbors $c_i = \frac{2 e_{jk} }{k_i(k_i - 1)}$ where $n_j, n_k \in N_i$, $e_{jk} \in E$
average clustering coefficient, $\langle C \rangle$	average clustering coefficient of nodes in the network $\langle C \rangle = \frac{1}{N} \sum_{n=1}^N c_i$
modularity, Q	proportion of edges that fall within subgroups of nodes minus the expected proportion if edges were randomly distributed, range $[-1, 1]$
average efficiency, E_G	measure of how efficiently information is exchanged in the network $E_G = \frac{1}{n(n - 1)} \sum_{i \neq j \in N} \frac{1}{d(n_i, n_j)}$
largest connected component	largest group of nodes in the network that are connected to each other in a single component
degree distribution, $P(k)$	probability distribution of node degrees in the network
γ	power-law exponent for the degree distribution
Small world structure	network with short average path lengths and relatively high clustering coefficient (relative to a random graph with similar density)
scale-free network	network with a degree distribution that is power-law distributed
